# Assignment 5

Shasha Li, 861306114

Please see the attached code.

As you can observe from the figure that the testing accuracy is still increasing around 30 epochs. I would say this suggest that if we further train the model, we could get a better result. Therefore, at epoch 30, the model is under-fitted.

Also we can observe that the testing accuracy is higher than training accuracy, which may be the effect of dropout.
